Ergonomical situation

- Two third of construction workers report on working positions in comprised working posture (hunched, kneeling, overhead) (BAuA, 2014)
- 82% of construction workers report on muskuloskeletal problems or pain in the last 12 months – 40% report on more than 4 different muskoloskeletal problems in the last 12 months (BAUA, 2014)
- 35-45% of construction workers complain about upper limb pain (Park H.J. and Jeong B.Y., 2021)
- MSDs common among construction workers. Over 40% of construction workers over 50 report persistent pain or physical problems (Wang et al., 2017)
- Elderly construction workers are more exposed to overload than their youger peers, workload has to be adjusted (Jebens et. al, 2015)

What are exoskeletons?

Definition

Electromechanical system, that can be worn by a person [...] in order to enhance the power of the muscles by a direct transfer of mechanical energy from the device to the human (Rukina et al., 2016)

Distinctions:

- By supported body areas
- By morphology
- By differences in actuating elements (actuators)

Exoskeletons and their type of support

Exoskeletons for prevention of MSD

Primary value in using occupational exoskeletons

- 1. Targeted body areas are those under high load
- Its use is meant to prevent the development of muskulokeletal ailments or diseases (MSD)

Work area and specific ergonomic angles

- Repetitive motions can be categorized by their main work areas
- These areas are marked by the primary angles in which the task is to be executed

passive vs. active exoskeletons – pros and cons*

General outcomes of occupational exoskeleton use*

YES

- reduces the physical load of employees
- extends the working capabilities of employees in the long run (healthy ageing)
- increase the attractiveness of the work environment for new target groups
- booster work safety

 receive feedback on ergonomics such as work density and possible overload

NO

- reduces the amount of employees needed for certain tasks
- increases work load per hour and thereby booster productivity
- enhances the employees capabilities to unknown heights
- get "disabled" personnel back to physical strenous jobs they can't do on their own anymore

* All statements are generalized and might not all apply to specific models

exolQ S 700 exoskeleton

- adjustable support level
- support when needed
- adjustable work area
- customizable pre-sets
- work ergonomics analysis

- Exoskeletons can be used to mitigate physical load and might ultimately reduce the amount of physiological ailments
- The use of exoskeletons is workplace specific
- Exoskeletons should be highly adjustable to individual needs
- Integration of exoskeletons at the workplace is to be planned ahead

Nevertheless - different workers might need different solutions – accept the heterogenity in your workforce !

Thank you very much for your attention!
